Access Management is Essential for Cloud Transformation

2019 Thales Access Management Index

Results from the 2019 Thales Access Management Index, a survey of 1050 executives in 11 countries with responsibility for, or influence over, IT and data security. Survey, reporting and analysis conducted by Vanson Bourne, commissioned by Thales.

94% of organizations’ security policies have been influenced by consumer breaches in the last 12 months.

49% of businesses believe cloud applications are the biggest targets for cyberattacks.

58% believe two-factor authentication is the most likely access management tool to protect cloud and web-based apps.

49% believe it is smart single sign-on and 47% biometric authentication.

62% of companies continue to operate without a CISO despite increased cybersecurity awareness.

97% are using smart SSO for cloud applications to condense cloud adoption.

95% believe that effective cloud access management can or does cause issues for their organization.
