SafeNet Authentication Client
Integration Guide

Using SafeNet Authentication Client CBA for Office 365
All information herein is either public information or is the property of and owned solely by Gemalto and/or its subsidiaries who shall have and keep the sole right to file patent applications or any other kind of intellectual property protection in connection with such information.

Nothing herein shall be construed as implying or granting to you any rights, by license, grant or otherwise, under any intellectual and/or industrial property rights of or concerning any of Gemalto’s information.

This document can be used for informational, non-commercial, internal and personal use only provided that:

- The copyright notice below, the confidentiality and proprietary legend and this full warning notice appear in all copies.
- This document shall not be posted on any network computer or broadcast in any media and no modification of any part of this document shall be made.

Use for any other purpose is expressly prohibited and may result in severe civil and criminal liabilities.

The information contained in this document is provided “AS IS” without any warranty of any kind. Unless otherwise expressly agreed in writing, Gemalto makes no warranty as to the value or accuracy of information contained herein.

The document could include technical inaccuracies or typographical errors. Changes are periodically added to the information herein. Furthermore, Gemalto reserves the right to make any change or improvement in the specifications data, information, and the like described herein, at any time.

Gemalto hereby disclaims all warranties and conditions with regard to the information contained herein, including all implied warranties of merchantability, fitness for a particular purpose, title and non-infringement. In no event shall Gemalto be liable, whether in contract, tort or otherwise, for any indirect, special or consequential damages or any damages whatsoever including but not limited to damages resulting from loss of use, data, profits, revenues, or customers, arising out of or in connection with the use or performance of information contained in this document.

Gemalto does not and shall not warrant that this product will be resistant to all possible attacks and shall not incur, and disclaims, any liability in this respect. Even if each product is compliant with current security standards in force on the date of their design, security mechanisms’ resistance necessarily evolves according to the state of the art in security and notably under the emergence of new attacks. Under no circumstances, shall Gemalto be held liable for any third party actions and in particular in case of any successful attack against systems or equipment incorporating Gemalto products. Gemalto disclaims any liability with respect to security for direct, indirect, incidental or consequential damages that result from any use of its products. It is further stressed that independent testing and verification by the person using the product is particularly encouraged, especially in any application in which defective, incorrect or insecure functioning could result in damage to persons or property, denial of service or loss of privacy.

Third-Party Software Acknowledgement

This document is intended to help users of Gemalto products when working with third-party software, such as Office 365.

Material from third-party software is being used solely for the purpose of making instructions clear. Screen images and content obtained from third-party software will be acknowledged as such.

Description

Remote access poses both a security and a compliance challenge to IT organizations. The ability to positively identify users (often remote users) requesting access to resources is a critical consideration in achieving a secure remote access solution. Deploying remote access solution without strong authentication is like putting your sensitive data in a vault (the datacenter), and leaving the key (user password) under the door mat.

A robust user authentication solution is required to screen access and provide proof-positive assurance that only authorized users are allowed access.

PKI is an effective strong authentication solution to the functional, security, and compliance requirements.

SafeNet Authentication Client (SAC) is a public key infrastructure (PKI) middleware that provides a secure method for exchanging information based on public key cryptography, enabling trusted third-party verification of user identities. Gemalto’s certificate-based tokens and smart cards provide secure remote access, as well as other advanced functions, in a single token, including digital signing, password management, network logon, and combined physical/logical access.

The tokens come in different form factors, including USB tokens, smart cards, and software tokens. All of these form factors are interfaced using a single middleware client, SafeNet Authentication Client (SAC). The SAC generic integration with CAPI, CNG, and PKCS#11 security interfaces enables out-of-the-box interoperability with a variety of security applications, offering secure web access, secure network logon, PC and data security, and secure email. PKI keys and certificates can be created, stored, and used securely with the hardware or software tokens.

Office 365 from Microsoft is a cloud-based service that is designed to help meet your organization’s needs for robust security, reliability, and user productivity.

This document provides guidelines for deploying certificate-based authentication (CBA) for user authentication to Office 365 using Gemalto tokens.

It is assumed that the Office 365 environment is already configured and working with static passwords prior to implementing Gemalto multi-factor authentication.

Office 365 can be configured to support multi-factor authentication in several modes. CBA will be used for the purpose of working with Gemalto products.

This document provides guidelines for deploying certificate-based authentication (CBA) for user authentication to Office 365 using Gemalto’s tokens and smart cards.

It is assumed that the Office 365 environment is already configured and working with static passwords prior to implementing Gemalto multi-factor authentication.

Office 365 can be configured to support multi-factor authentication in several modes. CBA will be used for the purpose of working with Gemalto products.
Applicability

The information in this document applies to:

- **SafeNet Authentication Client (SAC) Typical installation mode** — SafeNet Authentication Client is public key infrastructure (PKI) middleware that manages Gemalto’s tokens and smart cards.

- **SafeNet Authentication Client (SAC) IDGo800 Compatible mode** — IDGo800 Minidriver based package, uses Microsoft Smart Card Base Cryptographic Provider to manage Gemalto IDPrime MD smart cards.

  For more details about different SAC installation modes, refer to the Customization section in *SafeNet Authentication Client Administrator Guide.*

- **Office 365**

Environment

The integration environment used in this document is based on the following software versions:

- **SafeNet Authentication Client (SAC)** - Version 10.5
- **Office 365** - On Cloud
- **AD FS** - On Windows Server® 2012 R2

 Audience

This document is targeted to system administrators who are familiar with Office 365, and are interested in adding certificate based authentication capabilities using SafeNet tokens.
CBA Flow using SafeNet Authentication Client

The diagram below illustrates the flow of certificate-based authentication:

1. A user attempts to connect to Office 365. The user is redirected to AD FS proxy server (WAP) for authentication.
2. After successful authentication, the user is redirected to SafeNet Authentication Client (SAC) for a secondary authentication. The user uses the SafeNet token on which his certificate resides, and, when prompted, enters the token password.
3. The SAC authentication reply is sent back to AD FS, which returns a response to Office 365, accepting or rejecting the user’s authentication request.
4. The user is granted or denied access to Office 365.

Prerequisites

This section describes the prerequisites that must be installed and configured before implementing certificate-based authentication for Office 365 using Gemalto tokens and smart cards:

- To use CBA, the Microsoft Enterprise Certificate Authority must be installed and configured. In general, any CA can be used. In this guide, integration is demonstrated using Microsoft CA.
- If SAM is used to manage the tokens, Token Policy Object (TPO) should be configured with MS CA Connector. For further details, refer to the section “Connector for Microsoft CA” in the SafeNet Authentication Manager Administrator’s Guide.
- Users must have a Gemalto token or smart card enrolled with an appropriate certificate.
- SafeNet Authentication Client (10.5) should be installed on all client machines.
Supported Tokens and Smart Cards in SafeNet Authentication Client

SafeNet Authentication Client (10.5) supports the following tokens and smart cards:

**Certificate-based USB tokens**
- SafeNet eToken 5110 GA
- SafeNet eToken 5110 FIPS
- SafeNet eToken 5110 CC

**Smart Cards**
- Gemalto IDPrime MD 830 B
- Gemalto IDPrime MD 840 B
- Gemalto IDCore 30B eToken

For all supported devices please refer to *SafeNet Authentication Client Customer Release Notes*.
Configuring Office 365 and AD FS

Configuring Office 365 and AD FS requires the following:

- Enabling Office 365 Federated Domains, page 8.
- Configuring the AD FS Authentication Policy, page 9.

Enabling Office 365 Federated Domains

1. Log in to the AD FS server machine as a domain administrator.
3. At the command prompt, type `Connect-MsolService`, and then click Enter.
4. In the Enter Credentials window, enter your Azure AD administrator username and password, and then click OK.

5. At the command prompt, perform the following steps:
   a. Type `Set-MsolADFSContext -Computer <AD FS machine name>`, and then click Enter.
   b. Type `Convert-MsolDomainToFederated -DomainName <your domain name>`, and then click Enter.
6. Open the **AD FS Management Console**.

7. In the left pane, under **Console Root**, click **AD FS > Trust Relationships > Relying Party Trusts**. In the right pane, Microsoft Office 365 Identity Platform should be listed as a trust.

<table>
<thead>
<tr>
<th>Relying Party Trusts</th>
<th>Display Name</th>
<th>Enabled</th>
<th>Type</th>
<th>Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Registration Service</td>
<td>Yes</td>
<td>WS-T...</td>
<td>admin.dfs-2012adfs.aactests.com</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring the AD FS Certificate Based Authentication Policy**

1. On the **AD FS Management console**, in the left pane, under AD FS, click Authentication Policies.

2. In the right pane, click Edit Global Primary Authentication.
3. On the **Edit Global Authentication Policy** window, on the **Primary** tab, ensure that **Certificate Authentication** is selected for both **Extranet** and **Intranet**.

4. Click **OK**.
Running the Solution

Connecting to Office 365

1. Open the following URL in a web browser: https://login.microsoftonline.com

2. On the Office 365 login window, enter your AD user name (for example, Bob@sactests.com), and then click Next.

3. You will be redirected to your organization’s login page. Select the user certificate and click OK.
4. On the **SafeNet Authentication Client Token Logon** window, enter the token password, and then click OK.

![Token Logon](image)

5. After successful authentication, you are granted access to the **Office 365** dashboard.

![Office 365 Dashboard](image)
Appendix: Connecting to SharePoint in Office 365

Users can connect to SharePoint in Office 365 using their AD credentials and smartcards. Administrator will provide SharePoint URLs to users.

Connecting to SharePoint in Office 365 requires:

- Getting SharePoint URLs, Page 13
- Connecting to SharePoint, Page 15

Getting SharePoint URLs

1. Log in to **Office 365 admin center** as an administrator.

2. Click **Admin**. You will be redirected to the **Admin Center** page.
3. In the left pane select **Admin centers > SharePoint**.

   ![Office 365 Admin Center](image1.png)

   In the right pane, the Office 365 SharePoint URLs are listed.

   ![SharePoint Admin Center](image2.png)

4. Share any or all of the SharePoint URLs with other users.
Connecting to SharePoint

1. In a web browser, open any of the Office 365 SharePoint URLs received from the administrator.
2. On the **Office 365** login window, enter your AD user name (for example, **Bob@sactests.com**), and then click **Next**.

3. You will be redirected to your organization’s login page. Confirm the certificate and click **OK**.
4. On the **SafeNet Authentication Client** login window, enter the token password, and then click **OK**

After successful authentication, the Office 365 SharePoint console is displayed.
Appendix: Secure/Multipurpose Internet Mail Extensions (S/MIME) Configuration

Office 365 uses encryption in two ways: in the service and as customer control. S/MIME allows the user to encrypt email messages.

S/MIME protects your emails from unwanted access.

In order to configure S/MIME with Office 365 the user needs an Enterprise E3 license, in order to upload the certificate via the outlook email client.

**Prerequisites:**

1. Login as Windows Administrator.
2. Install MS KB as follows:
   - X86: Windows6.1-KB2819745-x86.msu
   - x64: Windows6.1-KB2819745-x64-MultiPkg.msu

**Export to SST file from the trusted Root CA**

1. On the CA computer, open the certificate manager, and select **Run > certmgr.msc**.
2. Expand Trusted Root Certification Authorities > Certificates.

3. Right click on the certificate which you bought for your business email (in our lab we used a self-signed CA, therefore we will use the Root CA certificate), then select All Tasks > Export.
NOTE: If you select one certificate, the export .sst option is greyed out, so you must select at least 2 certificates (For example, personal and intermediate certificates).

4. Click Next on the first **Certificate Export Wizard** screen, then select MicrosoftSerialized Certificate Store (.sst)

5. Click **Next**, then click **Browse** and select the location and file name where the .sst file will be saved.

6. Click **Next**, **Save** and then **Finish**.
Upload .sst file to Exchange Online

1. Open windows **PowerShell** (run as administrator).
2. Connect to the Office 365 admin account by running the command: `$UserCredential = Get-Credential`.
3. The Windows PowerShell credential request window opens. Enter the admin user name and password. Click **OK**.

4. Enter the following command in order to open a session with Exchange online:
   ```powershell
   ```

5. Enter the following command to remove restrictions for uploading the .sst file:
   ```powershell
   Set-ExecutionPolicy Unrestricted –force
   ```

6. Import the session:
   ```powershell
   Import-PSSession $Session
   ```

7. Change the path to where the .sst file was saved (for example, `cd c:`)

8. Upload the .sst file to Office 365:
   ```powershell
   $sst = Get-Content <SST file> -Encoding Byte
   ```

9. Configure the sst file to be used for S/MIME:
   ```powershell
   Set-SmimeConfig -SMIMECertificateIssuingCA $sst
   ```

10. Close the session:
    ```powershell
        Remove-PSSession $Session
    ```
Publish Certificate to GAL (Global Address List)

To encrypt emails with S/MIME we need to upload the user certificate to the GAL.

1. Open Outlook.

2. Select File > Options.

3. On the left pane select Trust Center and then on the right pane click Trust Center Settings.
4. On the left pane select **Email Security**.

5. In the Trust Center window click **Settings**. The **Change Security Setting** window opens.
6. On the Change Security Settings window, choose Security Setting Name and then click Choose, (to the right of the Signing Certificate field).

7. The **Confirm Certificate** window opens. Select the certificate issued by the CA you are going to use for S/MIME.

8. After choosing the certificate, click **OK**.
9. In the Trust Center window, click Publish to GAL in order to publish your certificate to Office 365. Once the certificate is uploaded to GAL, you will receive a confirmation message.

Enable S/MIME in Office 365 OWA

1. Login to Office 365 with the user credentials and click Office 365.
2. On the right pane select **Mail**

3. The user’s mail settings window opens. On the left pane select **S/MIME**
4. Check the checkboxes to support S/MIME and click **Save**.
Support Contacts

If you encounter a problem while installing, registering, or operating this product, please make sure that you have read the documentation. If you cannot resolve the issue, contact your supplier or Gemalto Customer Support. Gemalto Customer Support operates 24 hours a day, 7 days a week. Your level of access to this service is governed by the support plan arrangements made between Gemalto and your organization. Please consult this support plan for further information about your entitlements, including the hours when telephone support is available to you.
