SafeNet Authentication Client
Integration Guide

Using SafeNet Authentication Client CBA for Check Point Security Gateway
All information herein is either public information or is the property of and owned solely by Gemalto NV. and/or its subsidiaries who shall have and keep the sole right to file patent applications or any other kind of intellectual property protection in connection with such information.

Nothing herein shall be construed as implying or granting to you any rights, by license, grant or otherwise, under any intellectual and/or industrial property rights of or concerning any of Gemalto's information.

This document can be used for informational, non-commercial, internal and personal use only provided that:

- The copyright notice below, the confidentiality and proprietary legend and this full warning notice appear in all copies.
- This document shall not be posted on any network computer or broadcast in any media and no modification of any part of this document shall be made.

Use for any other purpose is expressly prohibited and may result in severe civil and criminal liabilities.

The information contained in this document is provided "AS IS" without any warranty of any kind. Unless otherwise expressly agreed in writing, Gemalto makes no warranty as to the value or accuracy of information contained herein.

The document could include technical inaccuracies or typographical errors. Changes are periodically added to the information herein. Furthermore, Gemalto reserves the right to make any change or improvement in the specifications data, information, and the like described herein, at any time.

Gemalto hereby disclaims all warranties and conditions with regard to the information contained herein, including all implied warranties of merchantability, fitness for a particular purpose, title and non-infringement. In no event shall Gemalto be liable, whether in contract, tort or otherwise, for any indirect, special or consequential damages or any damages whatsoever including but not limited to damages resulting from loss of use, data, profits, revenues, or customers, arising out of or in connection with the use or performance of information contained in this document.

Gemalto does not and shall not warrant that this product will be resistant to all possible attacks and shall not incur, and disclaims, any liability in this respect. Even if each product is compliant with current security standards in force on the date of their design, security mechanisms' resistance necessarily evolves according to the state of the art in security and notably under the emergence of new attacks. Under no circumstances, shall Gemalto be held liable for any third party actions and in particular in case of any successful attack against systems or equipment incorporating Gemalto products. Gemalto disclaims any liability with respect to security for direct, indirect, incidental or consequential damages that result from any use of its products. It is further stressed that independent testing and verification by the person using the product is particularly encouraged, especially in any application in which defective, incorrect or insecure functioning could result in damage to persons or property, denial of service or loss of privacy.

Third-Party Software Acknowledgement

This document is intended to help users of Gemalto products when working with third-party software, such as Check Point Security Gateway.

Material from third-party software is being used solely for the purpose of making instructions clear. Screen images and content obtained from third-party software will be acknowledged as such.

Description

Customers today are looking to desktop virtualization to transform static desktops into dynamic mobile workspaces that can be centrally and securely managed from the datacenter, and accessed across a wide range of devices and locations. Deploying desktop virtualization without strong authentication is like putting your sensitive data in a vault (the datacenter), and leaving the key (user password) under the door mat. A robust user authentication solution is required to screen access and provide proof-positive assurance that only authorized users are allowed access.

SafeNet Authentication Client (SAC) is a Public Key Infrastructure (PKI) middleware that provides a secure method for exchanging information based on public key cryptography, enabling trusted third-party verification of user identities. SafeNet’s certificate-based tokens provide secure remote access, as well as other advanced functions, in a single token, including digital signing, password management, network logon, and combined physical/logical access.

The tokens come in different form factors, including USB tokens, smart cards, and software tokens. All of these form factors are interfaced using a single middleware client, SafeNet Authentication Client (SAC). The SAC generic integration with CAPI, CNG, and PKCS#11 security interfaces enables out-of-the-box interoperability with a variety of security applications offering secure web access, secure network logon, PC and data security, and secure email. PKI keys and certificates can be created, stored, and used securely with the hardware or software tokens.

SafeNet Authentication Manager (SAM) provides your organization with a comprehensive platform to manage all of your authentication requirements, across the enterprise and the cloud, in a single, integrated system. SAM enables management of the complete user authentication life cycle. SAM links tokens with users, organizational rules, and security applications to allow streamlined handling of your organization’s authentication infrastructure with a flexible, extensible, and scalable management platform.

SAM is a comprehensive token management system. It is an out-of-the-box solution for Public Certificate Authorities (CA) and enterprises to ease the administration of SafeNet’s hardware or software tokens devices. SAM is designed and developed based on the best practices of managing PKI devices in common PKI implementations. It offers robust yet easy to customize frameworks that meets different organizations’ PKI devices management workflows and policies. Using SAM to manage tokens is not mandatory, but it is recommended for enterprise organizations.

For more information, refer to the SafeNet Authentication Manager Administrator Guide.

Check Point Security Gateway protects dynamic virtualized environments and external networks (such as private and public clouds) from internal and external threats, by securing virtual machines and applications with a full range of Check Point Software Blades.

This document provides guidelines for deploying certificate-based authentication (CBA) for user authentication to Check Point Security Gateway using SafeNet tokens. It is assumed that the Check Point Security Gateway environment is already configured and working with static passwords prior to implementing SafeNet multi-factor authentication. Check Point Security Gateway can be configured to support multi-factor authentication in several modes. CBA will be used for the purpose of working with SafeNet products.
Applicability

The information in this document applies to:

- SafeNet Authentication Client (SAC)
- Check Point Security Gateway

Environment

The integration environment that was used in this document is based on the following software versions:

- SafeNet Authentication Client (SAC) — 10.4
- Check Point Security Gateway — R80.10
- Check Point VPN Client endpoint security VPN - E80.70 (Standalone)

Audience

This document is targeted to system administrators who are familiar with Check Point Security Gateway, and are interested in adding certificate-based authentication capabilities using SafeNet tokens.

CBA Flow using SafeNet Authentication Client

The diagram below illustrates the flow of certificate-based authentication:

1. A user attempts to connect to the Check Point Security Gateway server using the Check Point Security Gateway client application. The user inserts the SafeNet token on which his certificate resides, and, when prompted, enters the token password.
2. After successful authentication, the user is allowed access to the internal resource.
Prerequisites

This section describes the prerequisites that must be installed and configured before implementing certificate-based authentication for Check Point Security Gateway using SafeNet tokens:

- To use CBA, the Microsoft Enterprise Certificate Authority must be installed and configured. In general, any CA can be used. However, in this guide, integration is demonstrated using Check Point GW internal CA.
- If SAM is used to manage the tokens, Token Policy Object (TPO) should be configured with MS CA Connector. For further details, refer to the section “Connector for Microsoft CA” in the SafeNet Authentication Manager Administrator’s Guide.
- Users must have a SafeNet token with an appropriate certificate enrolled on it.
- SafeNet Authentication Client (10.4) should be installed on all client machines.

Supported Tokens in SafeNet Authentication Client

SafeNet Authentication Client (10.4) supports the following tokens and smart cards:

Certificate-based USB tokens

- SafeNet eToken 5110 GA
- SafeNet eToken 5110 FIPS
- SafeNet eToken 5110 CC

Smart Cards

- Gemalto IDPrime MD 830
- Gemalto IDPrime MD 840

For all supported devices please refer to SafeNet Authentication Client Customer Release Notes.
Configuring Check Point Security Gateway

The Check Point Smart Dashboard application can be used to configure the Check Point Remote Access VPN.

Configuring Check Point Security Gateway requires:

- Creating a User and Issuing a Registration Key, page 7
- Creating a User Group, page 12
- Enabling Authentication for the VPN Client, page 14
- Configuring a Firewall Rule for the VPN Client, page 16
- Installing a Policy, page 19
- Enrolling a Certificate, page 21
- Enabling Smart card removal detection, page 25

Creating a User and Issuing a Registration Key

A user is created with a defined authentication scheme to log in to the Check Point Endpoint Security VPN Client and access its applications. Then, the administrator initiates the certificate process on the Security Management server (or ICA management tool), and is given a registration key.

1. Open the Check Point SmartConsole R80.10.
2. On the login window, complete the following fields, and then click Login.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>Enter your user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter your password.</td>
</tr>
<tr>
<td>Server Name or Server IP Address</td>
<td>Select the name or IP address of the server where Check Point Security Gateway is hosted.</td>
</tr>
<tr>
<td>Read only</td>
<td>Clear this option.</td>
</tr>
</tbody>
</table>

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
3. On the Check Point SmartConsole main window, under **Objects**, select **More Object types > User** and then click **New User**.

![Check Point SmartConsole](image1.png)

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).

4. Choose **Default** and click **OK**.

![New User](image2.png)

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
5. On the **User Properties** window, in the **User Name** field, enter the name of the user (for example, **Alice**).

6. Click **OK**.

   The user is created.

7. On **Search Bar** find the user created and click the user name

   (The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
8. In the **User** window, click **Certificates**.

![User Window with Certificates Section](image)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

9. Click **New**, and then select **Registration Key for certificate enrollment**.

![User Window with Registration Key Option](image)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*
10. In the **Registration Key for Certificate Enrollment** window, a registration key is displayed. Copy this registration key, save it (where you can retrieve it later for certificate enrollment), and then click **OK**.

![](image1.png)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners)*.

In the **User Properties** window, in the **Certificate list**, a **Pending enrollment** certificate status is added.  

11. Click **OK**.

![](image2.png)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners)*.
Creating a User Group

A user group is a set of users who have related responsibilities or perform related tasks. Similar to individual users, user groups can be specified in policy rules.

**NOTE:** Creating a group enables you to allow some of your users to perform some tasks, but not others. Firewalls do not allow you to define rules for individual users, but you can define rules for groups.

1. On the Check Point SmartConsole main window, under Objects, select More Object types > User and then click New User Group.

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
2. On the **Group Properties** window, complete the following fields, and then click **OK**.

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter the name of the group (for example, <em>Remote_access_group</em>).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Members/Selected Members</td>
<td>In the <strong>All</strong> list, select the members to add to the group, and then click <strong>Add (+ sign)</strong>. These members are in the <strong>Members</strong> list.</td>
</tr>
</tbody>
</table>

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).

3. The user is added. Click **OK**.

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
Enabling Authentication for the VPN Client

1. On the **Check Point SmartConsole** in **Gateways & Servers** left tab, expand **Check Point**, right-click your device (for example, GWR80.10), and then click **Edit**.

   (The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).

2. In the **Check Point Gateway – Checkpoint-ssl** window, expand **VPN Clients**, and then click **Authentication**.

   (The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
3. Next to **Authentication Method**, click on **Settings**.

![Image of Check Point Gateway - GWR80.10](The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).

4. Under **Authentication Methods**, select **Defined On User record (Legacy)**, and then click **OK** twice.

![Image of Single Authentication Clients Settings](The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
Configuring a Firewall Rule for the VPN Client

A security gateway object has at least one firewall blade installed that serves as an entry point to the corporate network.

The firewall rule is a policy definition of what is allowed and what is blocked by the firewall. Rules are based on the concept of objects. For example, networks objects can be used in the source and destination of rules.

1. In the **Check Point SmartConsole**, in the main window in the left tab, click **Security Policies**

   ![Security Policies](image1.png)

   *(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

2. Click **Policy**, and then click **Add rule below**.

   ![Add rule below](image2.png)

   *(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

A row is added below the Policy icon bar.

![Policy](image3.png)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

3. In the **Name** column, right-click the new row, and then click **Edit**.

   ![Edit](image4.png)

   *(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*
4. In the **Rule Name** window, in the **Rule Name** field, add a name for the firewall rule.

   ![Image of Rule Name window](image1.png)

   *(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

5. In the **Destination** column, right-click the new row, and then click **add new item**.

   ![Image of Destination column](image2.png)

   *(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

6. In the **Search Object** window, select **InternalNet** which is an alias for the internal network in an organization.

   ![Image of Search Object window](image3.png)

   *(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*
7. In the **VPN** column, right-click the new row, and then click **Specific VPN Communities**.

![Image of VPN configuration](image)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

8. In the search window, select **RemoteAccess**.

![Image of policy configuration](image)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

The new policy is created.

![Image of policy configuration](image)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*
Installing a Policy

The policy installation process does the following:

- Performs a heuristic verification on rules to ensure they are consistent, and that no rule is redundant.
- Confirms that each of the Security Gateways on which the rule is enforced (known as Install On object) enforces at least one of the rules.
- Converts the Security Policy into an Inspection Script, and compiles this script into an Inspection Code.
- Distributes Inspection Codes to the selected installation targets.

1. In the **Check Point SmartConsole** main window, in the icon bar at the top, click **Install Policy**.

![Check Point SmartConsole](image1.png)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

2. Click **Publish & install**

![SmartConsole Publish & Install](image2.png)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*
3. In the **Install Policy** window, in **policy Targets** select the option for your device (for example, **GWR80.10**), and then click **Install**.

![Install Policy window](image)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners)*.

4. When the installation is complete, click **Close**.

![Recent Tasks](image)

*(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners)*.
Enrolling a Certificate

The client establishes an SSL connection to the Check Point's Internal Certificate Authority (ICA) and completes the certificate generation process using the registration key. When you enroll a certificate with Endpoint Security for the first time, provide the registration key and enroll a certificate in the token.

1. Insert the SafeNet SmartCard/Token first into your USB slot, and then open the Check Point Endpoint Security application.
   
   The IP address in the Site field is same one that was configured during the installation. Also during the installation, Certificate was the selected Authentication option.

2. Click the Click here if you don't have a certificate for this site link.

3. In the Provider field, select eToken Base Cryptographic Provider

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
4. In the **Registration Key** field, enter the registration key that you saved in step “Creating a User and Issuing a Registration Key” on page 7, and then click **Enroll**.

5. On the **Token Logon** window, in the **Token Password** field, enter your SafeNet eToken password, and then click **OK**.

Certificate enrollment proceeds.

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
A security warning message is displayed. This is the certificate offered by Check Point’s Internal Certificate Authority (ICA).

6. Click Yes.

7. When the enrollment has completed, click Close

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
8. Open the **SafeNet Authentication Client** tools application and verify that the certificate is issued to the user.
Enabling Smart card removal detection

1. In the Check Point Gateway, edit the file $FWDIR/conf/trac_client_1.ttm using VI or any other text editor.
2. Locate the disconnect_on_smartcard_removal line:

```
*:disconnect_on_smartcard_removal ( 
  :gateway ( 
    :default (true) 
  )
)*
```

3. Change the default property as follows:

- **true** - Enables smart card removal detection for all connections to the current gateway
- **false** - Disable smart card removal detection for all connections to the current gateway
- **client_deside** - Enables or disables smart card removal detection individually for each client

4. Save the file and exit.
5. Install the policy using the Smart Dashboard.
6. On the client machine, open the Check Point Endpoint Security properties window and select the Checkbox **Enable always-connect**.

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
Running the Solution

1. Open the **Check Point Endpoint Security** application.
2. Insert the SafeNet eToken into your USB slot. The certificate on the eToken is propagated in the Certificate field. Click Connect.

   ![Screen Image](image-url)  

   *(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).*

3. On the **Token Logon** window, in the Token Password field, enter your token password, and then click OK.
4. On the right side of the task bar, click on the VPN client process to see the VPN connection status. When the authentication succeeds, the VPN connection status is shown as **Connected**.

(The screen image above is from Checkpoint®. Trademarks are the property of their respective owners).
Support Contacts

If you encounter a problem while installing, registering, or operating this product, please make sure that you have read the documentation. If you cannot resolve the issue, contact your supplier or Gemalto Customer Support. Gemalto Customer Support operates 24 hours a day, 7 days a week. Your level of access to this service is governed by the support plan arrangements made between Gemalto and your organization. Please consult this support plan for further information about your entitlements, including the hours when telephone support is available to you.
